“Online Book Store”

Project Review

Prof: Jayashree J

Made By: Ritik Pratap Singh(18BCE0631)

Vaibhav Singh(18BCE2313)

Ritvik Kataria(18BCE0873)

Rishav Panchal(18BCE2275)

Abstract:

In this project we have built an online bookstore named GreenTreeBooks that sells books of various categories and written by several authors. The book inventories are stored in MySql in phpmyadmin. Customers can access the online bookstore through the internet. Customers will be able to dynamically search the database to find the books they want and place the order to buy the book using the cash on delivery option.

Online Book store is an online web application where the customer can purchase books online. Through a web browser the customers can search for a book by its title or author, later can add to the shopping cart and finally purchase using cash on delivery. The user can login using his account details or new customers can set up an account very quickly. They should give the details of their name, contact number and shipping address. The books are divided into many categories based on subject like fiction, children's book, Editor's Choice, Scientific, Exam Preparation, Biography, etc.

The Online Book Store Website provides customers with online shopping through a web browser. A customer can, create, sign in to his account, place items into a shopping cart and purchase using his credit card details.

The Administrator will have additional functionalities and access when compared to the common user. He can add, delete and update the book details.

Design and Methodology:

In this project several technologies were used:

- HTML language for web
- MySql for database
- Javascript
- PHP
- XAMPP server
- Bootstrap 4

Three-tier (layer) is a client-server architecture in which the user interface, business process (business rules) and data storage and data access are developed and maintained as independent modules or most often on separate platforms.

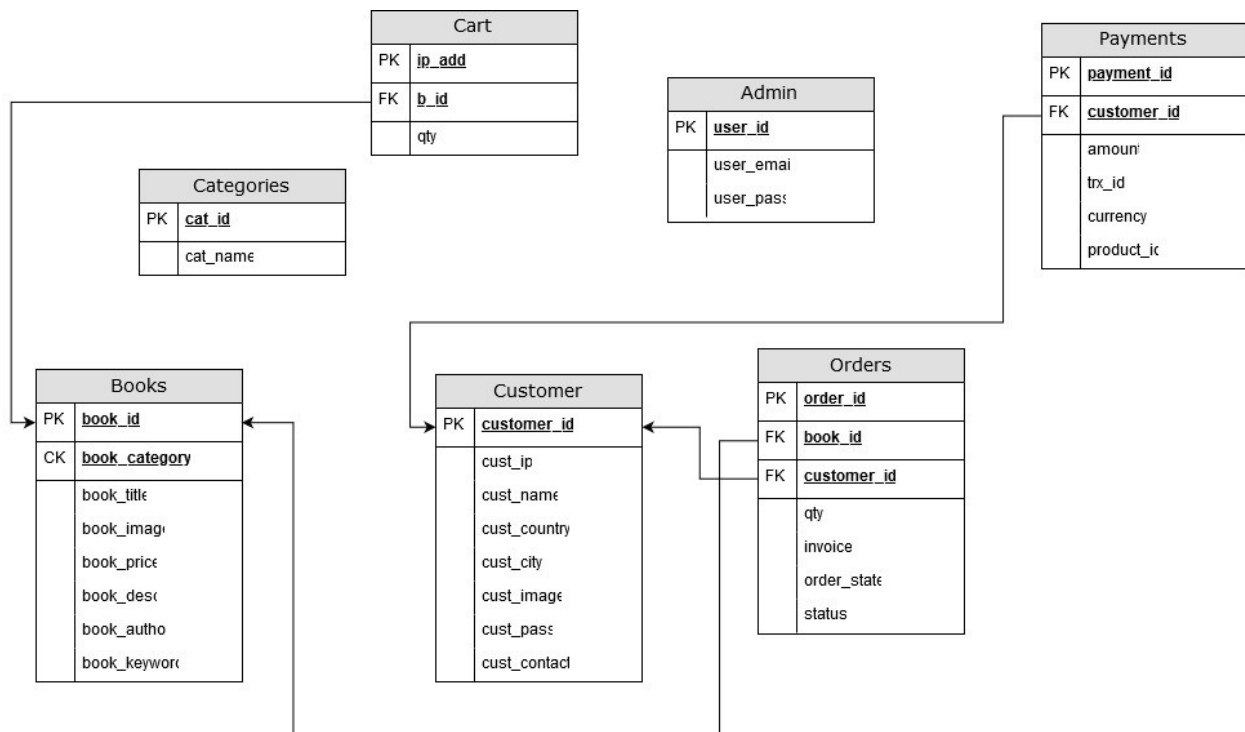

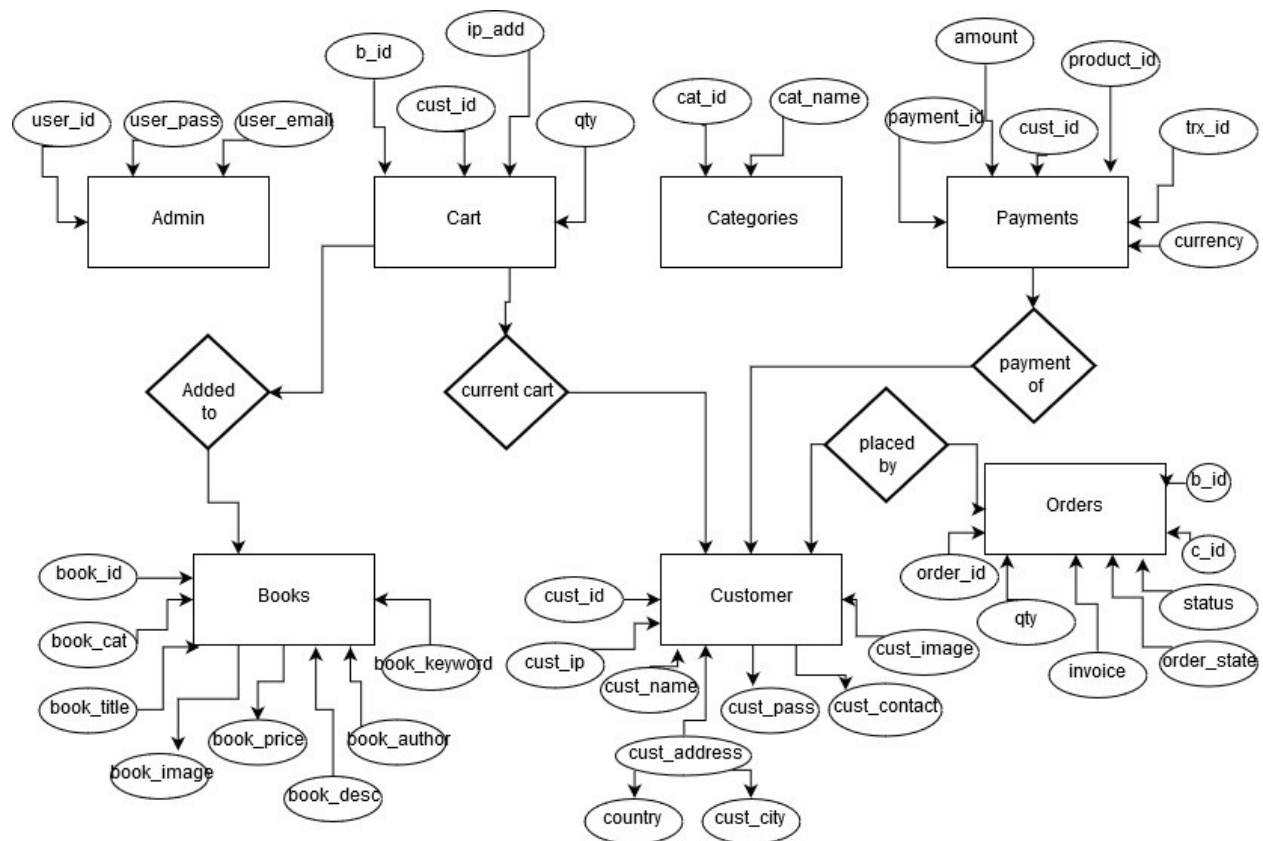

The Architecture of Online Book Store is based on three-tier architecture.

The three logical tiers are

- GUI tier – HTML forms , BootStrap4 , javascript
- Middle tier – PHP functions.
- Data tier-MySQL Database

ER Diagram and Relational Model:

Description: In A Brief History of Time, Hawking writes in non-technical terms about the structure, origin, development and eventual fate of the Universe, which is the object of study of astronomy and modern physics. He talks about basic concepts like space and time, basic building blocks that make up the Universe (such as quarks) and the fundamental forces that govern it (such as gravity). He writes about cosmological phenomena such as the Big Bang and black holes. He discusses two major theories, general relativity and quantum mechanics, that modern scientists use to describe the Universe. Finally, he talks about the search for a unifying theory that describes everything in the Universe in a coherent manner.
